Summary

Computer Science undergraduate who builds and ships real systems instead of only calling library APIs. Built an adversarial benchmark for incident response agents, trained and deployed a conditional diffusion model for music, and shipped a multi-agent backend that handles 100+ concurrent requests at sub-100ms latency.

Education

Atria University

B.Tech, Data Science & Artificial Intelligence (CGPA: 8.4/10)

Expected Jul 2027

Bengaluru

Experience

Co-Founder, Undark — AI Case Intelligence for Debt Recovery

IIMA Ventures AI Summer Residency

May 2026 – Jun 2026

IIM Ahmedabad

- Selected to the inaugural IIMA Ventures AI Residency (43 out of 11,500+ applicants) and completed sector immersion in collections.
- Built a Python MVP that parses case files, reconstructs timelines, and flags contradictions across lender and bureau data; demoed live to investors.

Research Apprentice — Weather & Energy Forecasting

ACAD, Atria Centre of Excellence in AI & Decentralized Tech

Jan 2026 – Apr 2026

Bengaluru

- Forecasted Global Horizontal Irradiance (GHI) for solar applications using LSTM and Temporal Fusion Transformer time-series models.
- Compared model performance across forecast horizons and reported results as part of ongoing weather-energy research under Prof. Dinker Mattam.

Projects

SRE-Bot — Autonomous Incident Remediation Benchmark

Python, FastAPI, Docker, Next.js

2026

Meta x Scaler OpenEnv Hackathon

- Designed an adversarial incident environment that checks if an agent can find the true root cause instead of reacting to the noisiest alert.
- Implemented a process-supervised reward model plus a Dockerized FastAPI engine and Next.js dashboard for reproducible, real-time evaluations.

Adaptive Soundtrack AI — Conditional Diffusion Model for Music

Python, PyTorch, DDPM/DDIM

2026

- Implemented a conditional DDPM with a U-Net backbone and FiLM-based genre conditioning, including the full training pipeline on LPD5.
- Reached a low validation loss on held-out data and added DDIM sampling to cut inference from 1000 steps to 50 while keeping output quality.

AI Recruiting Platform

Python, FastAPI, MongoDB, Docker

Jan 2026 – Mar 2026

- Built a backend of five collaborating agents (CrewAI, LangChain, FAISS) to screen candidates and answer recruiter queries.
- Load-tested and tuned the system to handle 100+ concurrent requests at sub-100ms latency, with drift alerts to catch silent model degradation.

Technical Skills

Languages: Python, SQL, Bash, JavaScript (1+ year OOP).

Algorithms & ML: Data structures, time-series models, DDPM/DDIM sampling, process-supervised reward design.

Systems & Infra: FastAPI, Docker, GitHub Actions CI, Next.js, WebSockets, LangChain, Linux, MongoDB, PostgreSQL, GCP Vertex AI.

Certifications

NLP with Classification and Vector Spaces | NLP with Sequence Models | AI on Jetson Nano | RAGxthon 2026 — Agents in Production Hackathon
